

# Chapter 2

## **Overview of Architecture and Microcontroller-Resources**

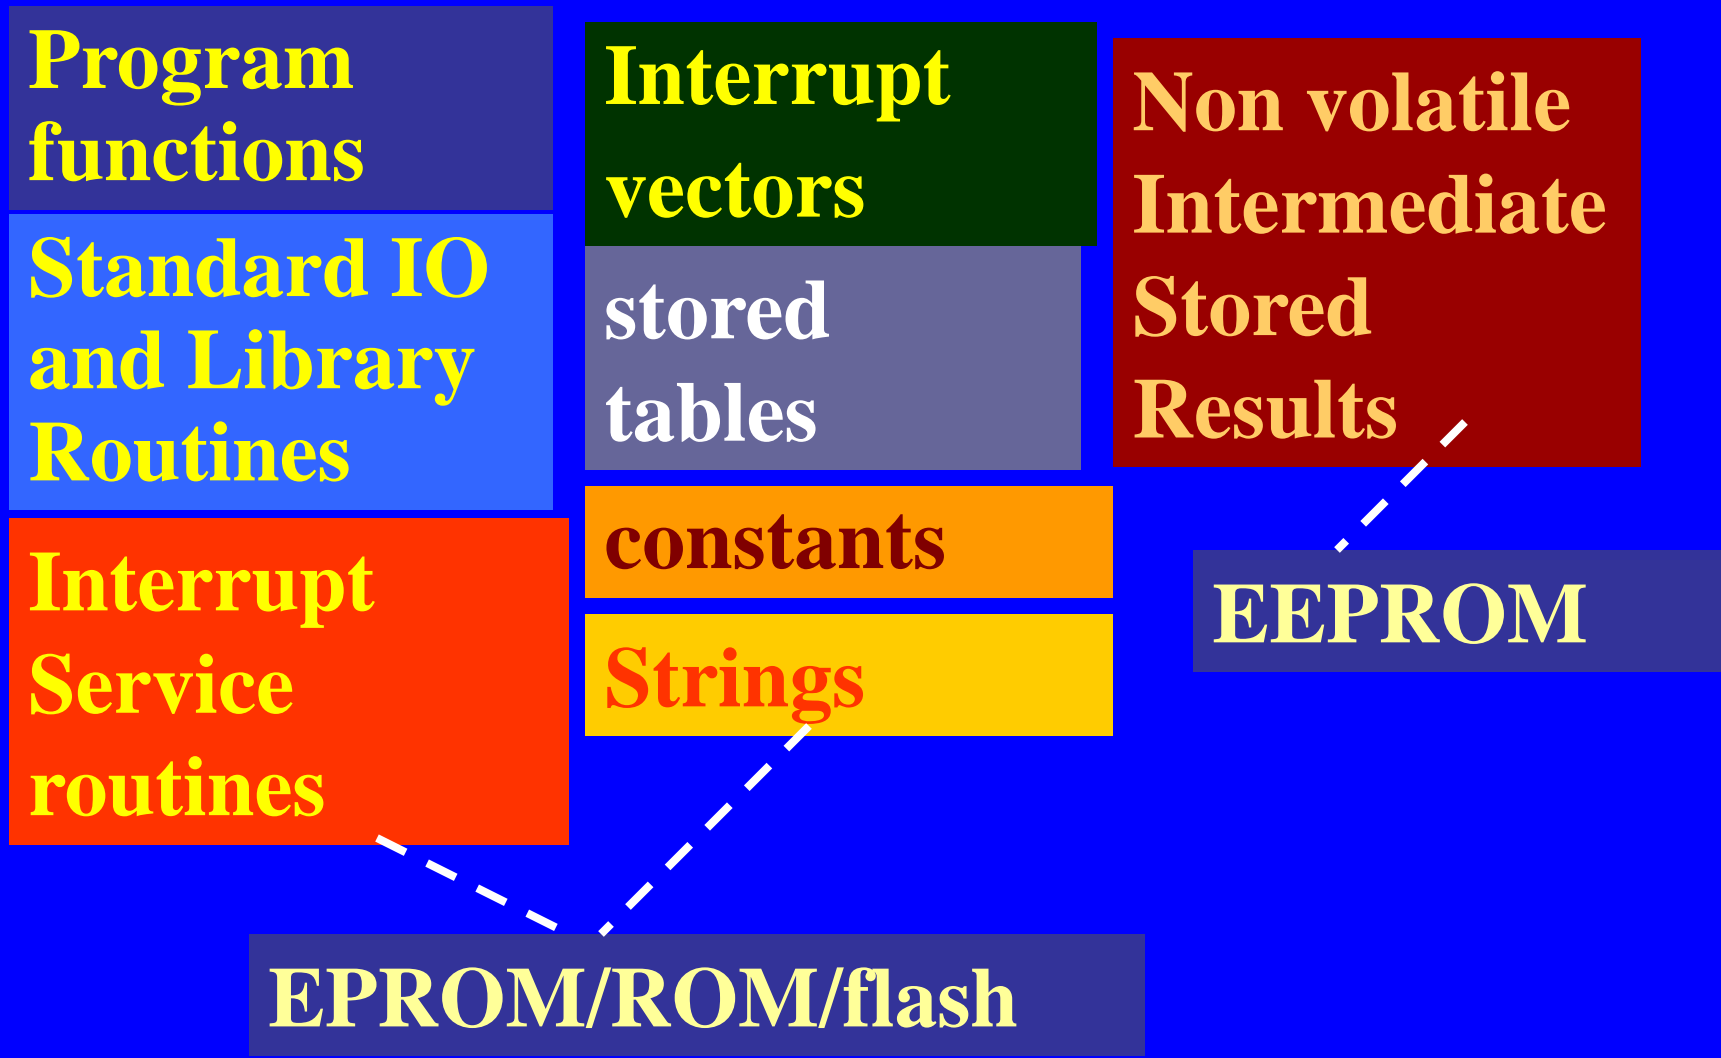

# Lesson 2

## **Program and Data Memory, Ports, EEPROM and FLASH**

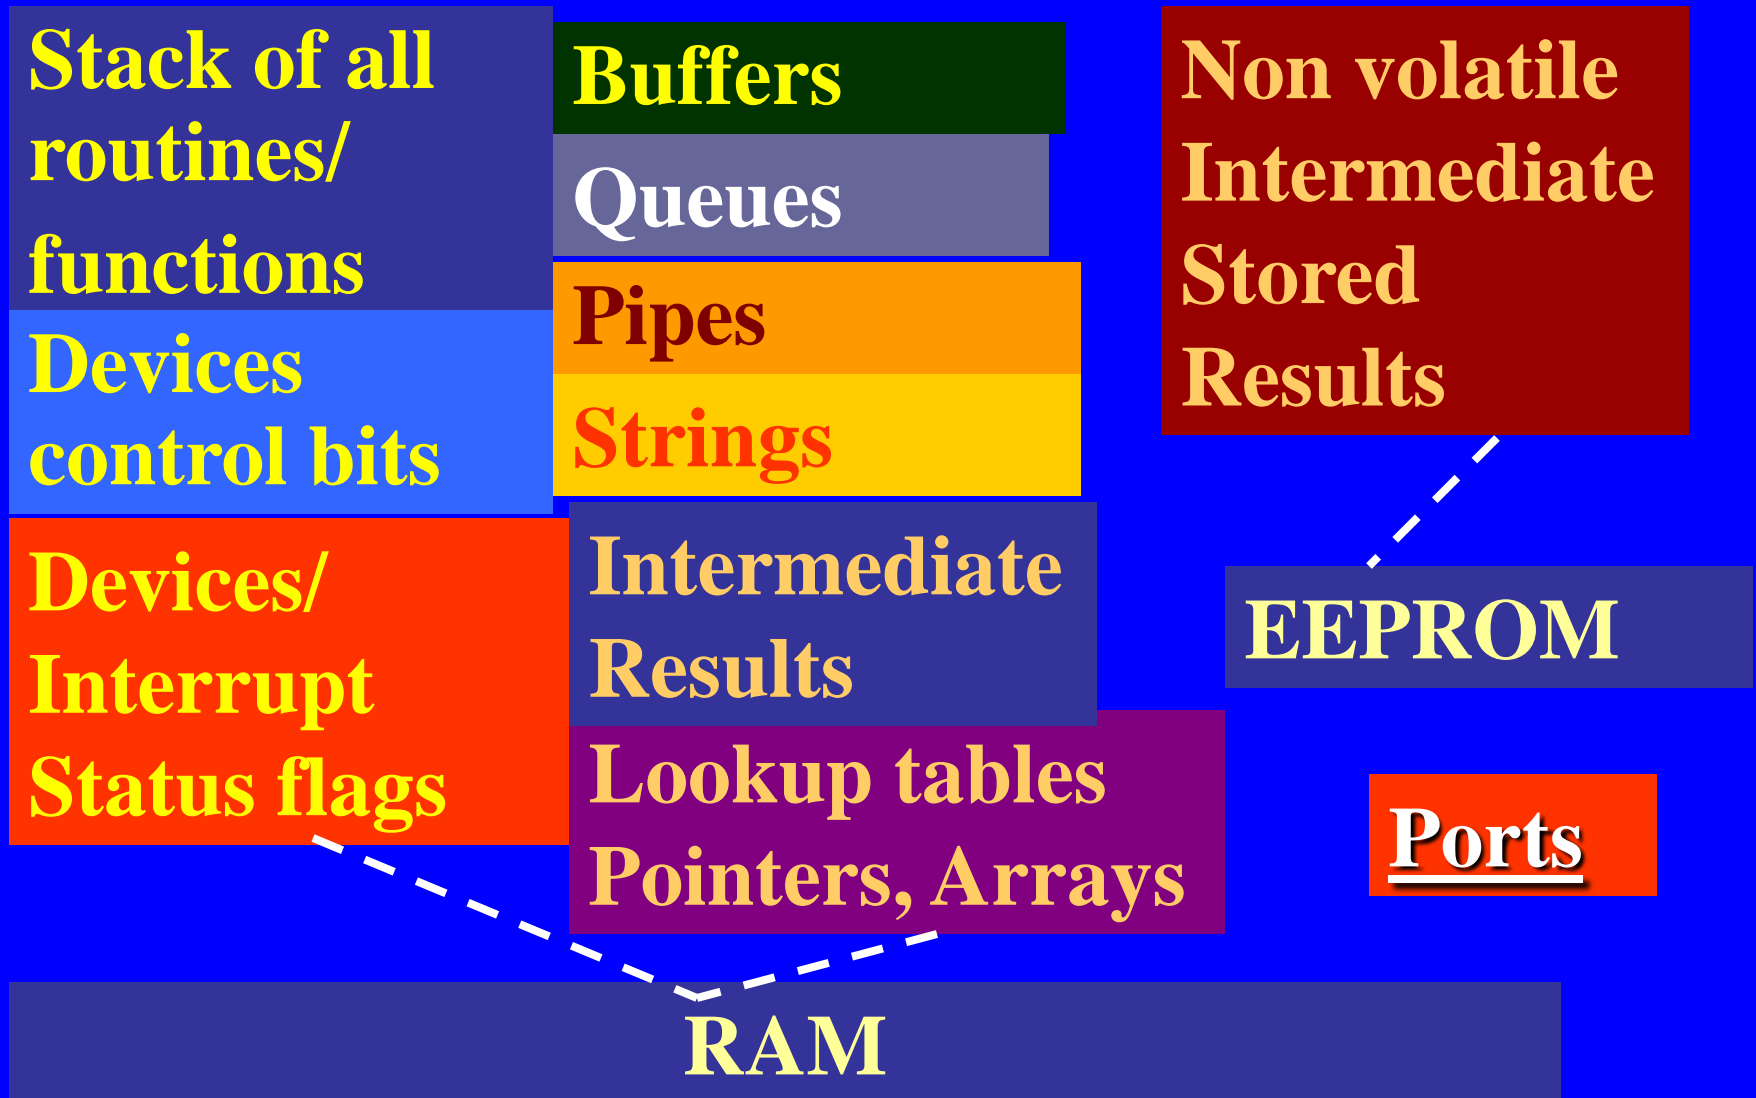

# Microcontroller-resources

# Program Memory Address Space

# Data Memory Address Space

# Memory Architecture

- Harvard Memory architecture -  
Separate memory address spaces for  
Data Memory and Program memory
- Princeton Memory architecture -  
Common memory address space for  
Data Memory and Program memory

# Common address spaces for program and data memory

Internal  
16-bit  
bus

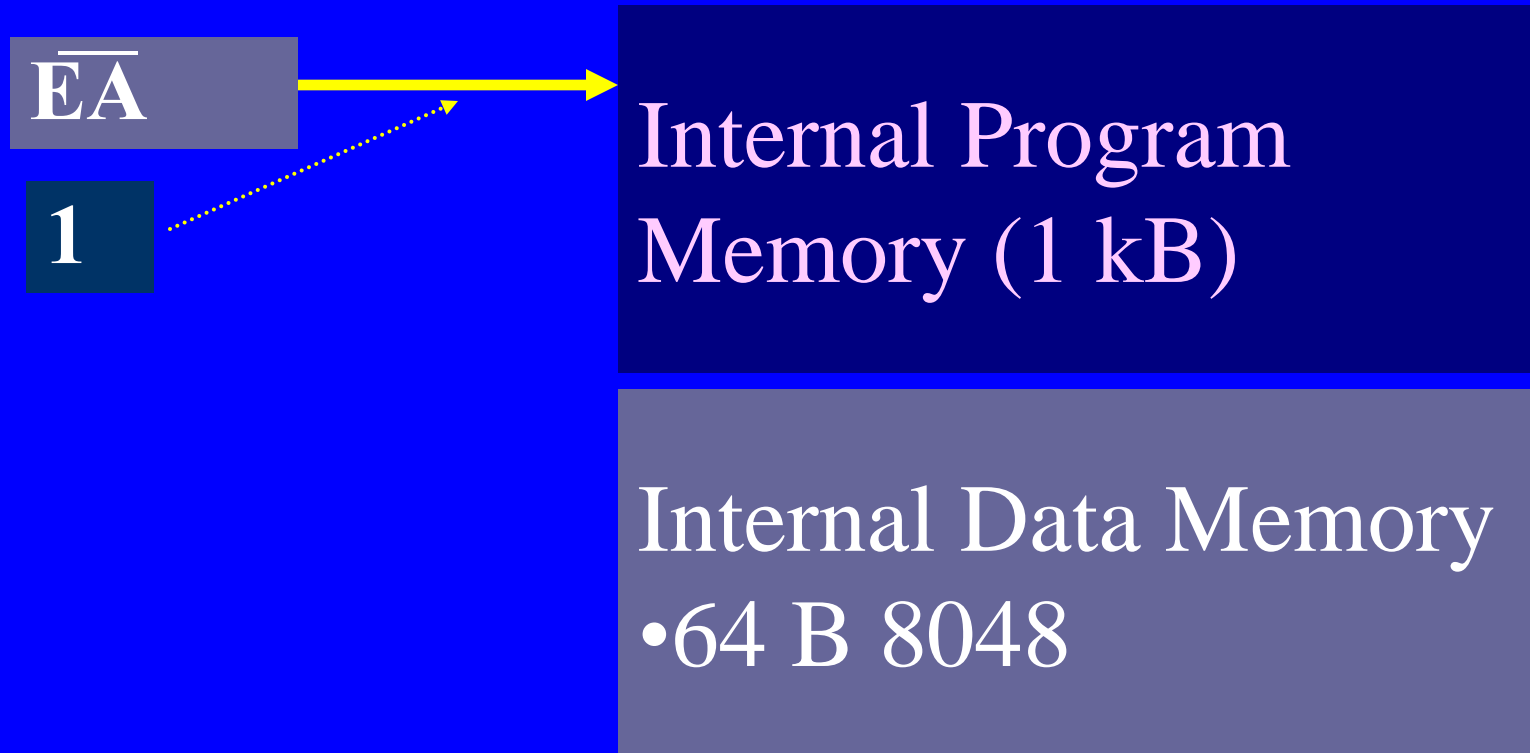

Internal Program/Data  
Memory (16 kB)

Internal Data Memory  
• 512 B 80196KC

16 kB Common address spaces for program and data memory

# Internal Memory Accessibility

# MCU Expanded Mode used for interfacing

- External Data Memory  
and External Program memory

## Interfaced using Ports

**A<sub>n</sub>-A15**

# Expansion Mode

**PSEN**

Program memory

**ALE**

A15  
A14  
A13  
A12  
A11  
A10  
A9  
A8

AD7  
AD6  
AD5  
AD4  
AD3  
AD2  
AD1  
AD0

**Latch**

**Address Decoder**

$\overline{CS}$   
 $\overline{CS}$

**A0-A15**

Port P2 Option

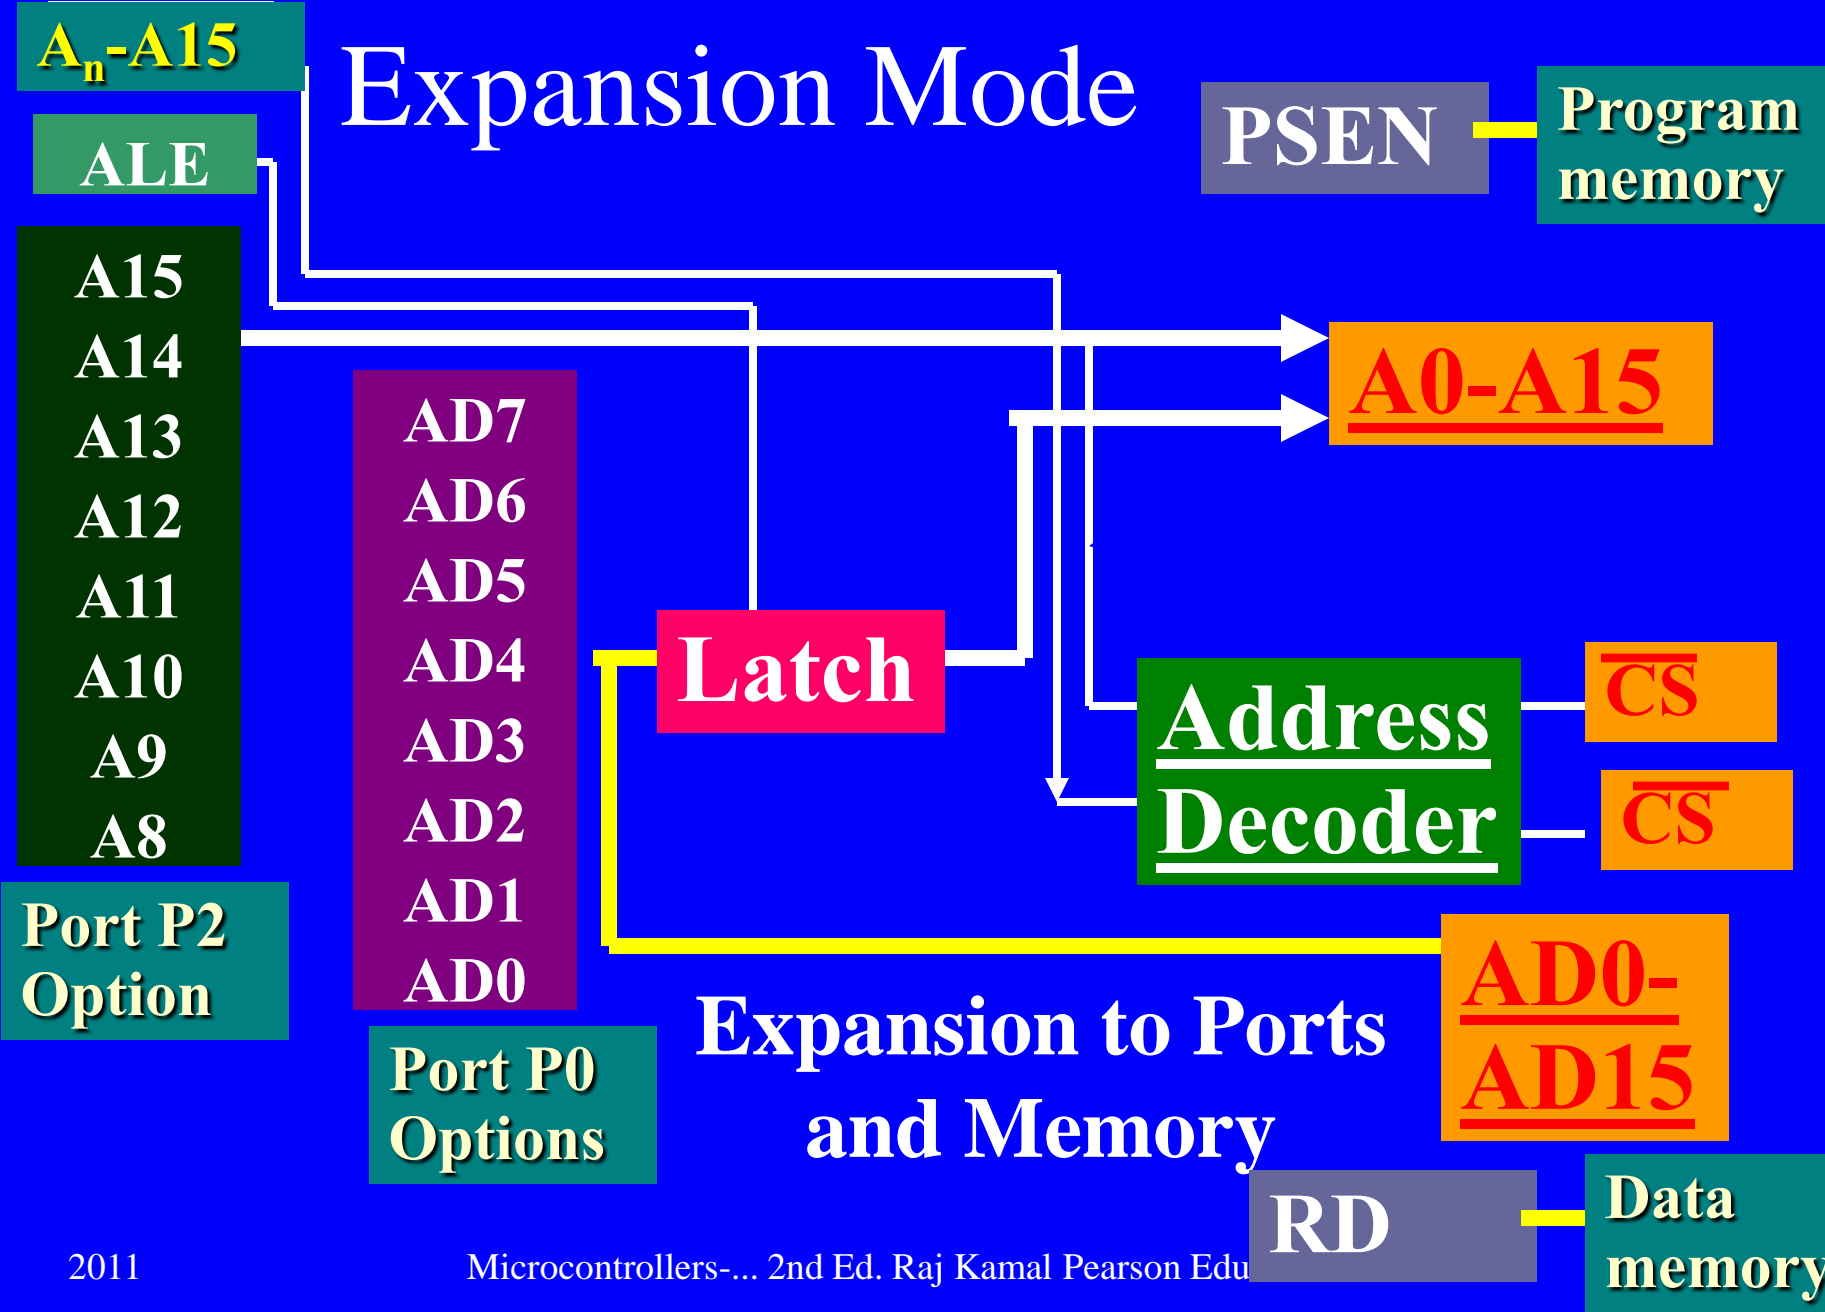

Port P0 Options

## Expansion to Ports and Memory

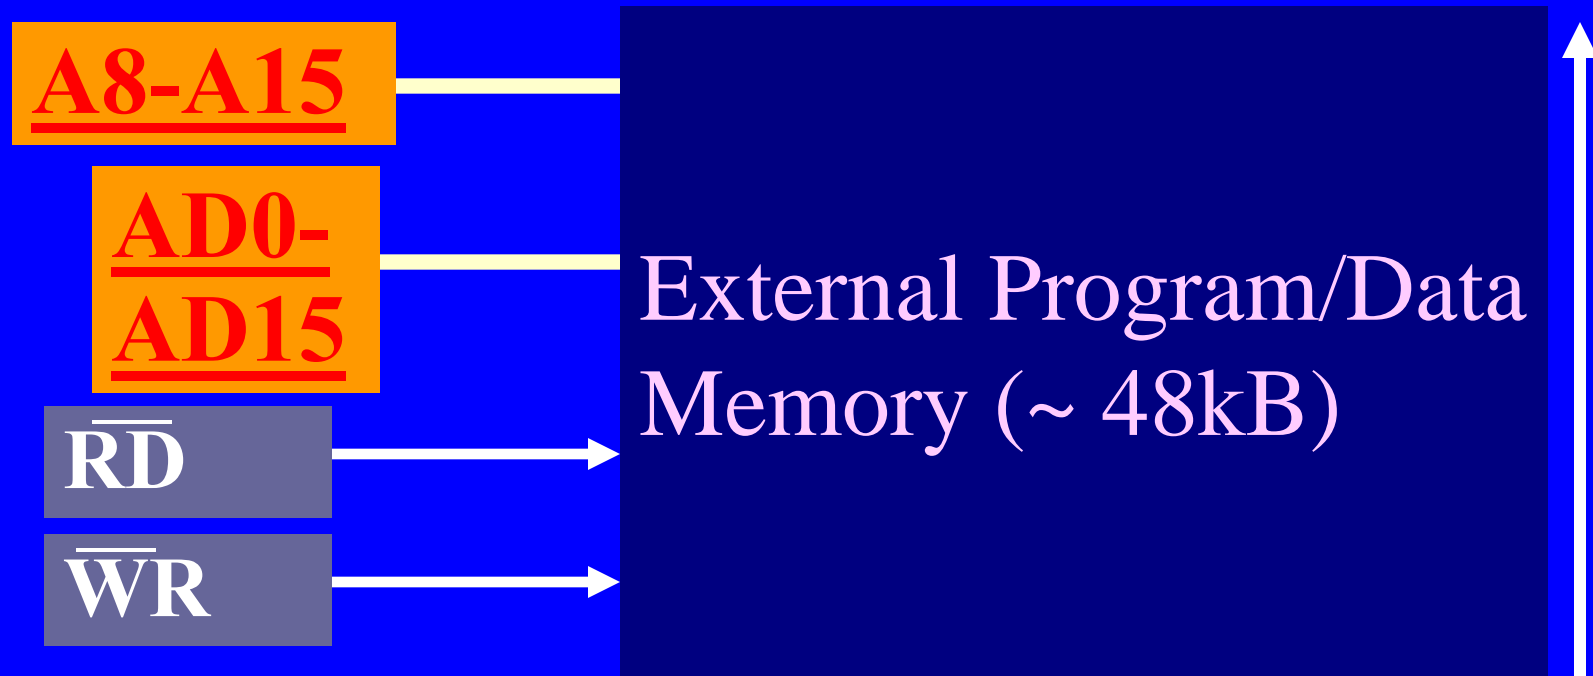

**AD0-AD15**

**RD**

Data memory

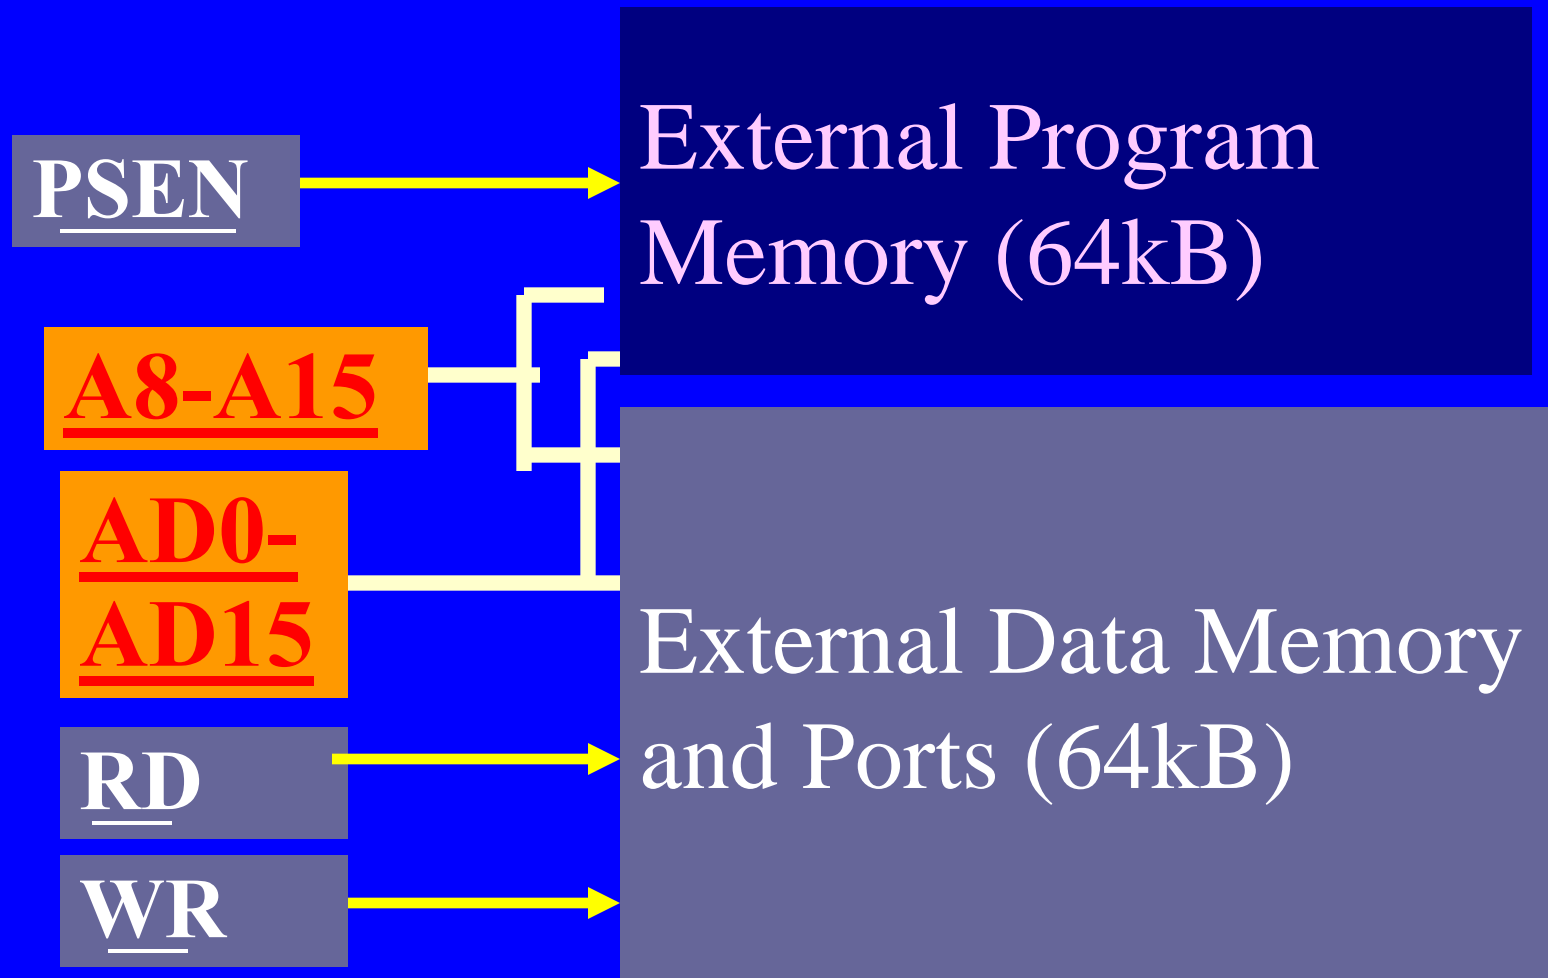

# External Memory Princeton Architecture Example- 80196KC

48 kB Common address spaces for program  
and data memory

# External Memory Harvard Architecture - 8048

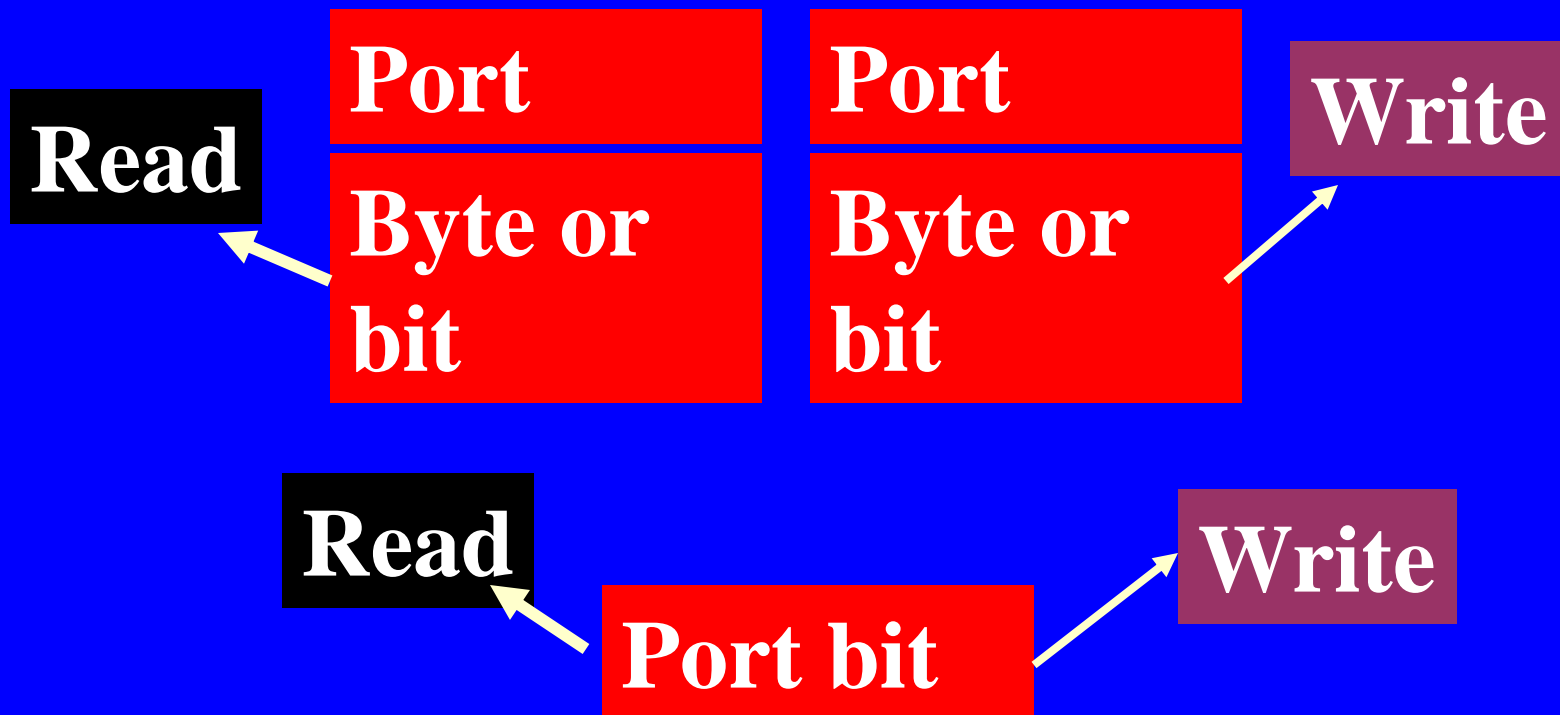

# Ports

# Ports in Data Memory space

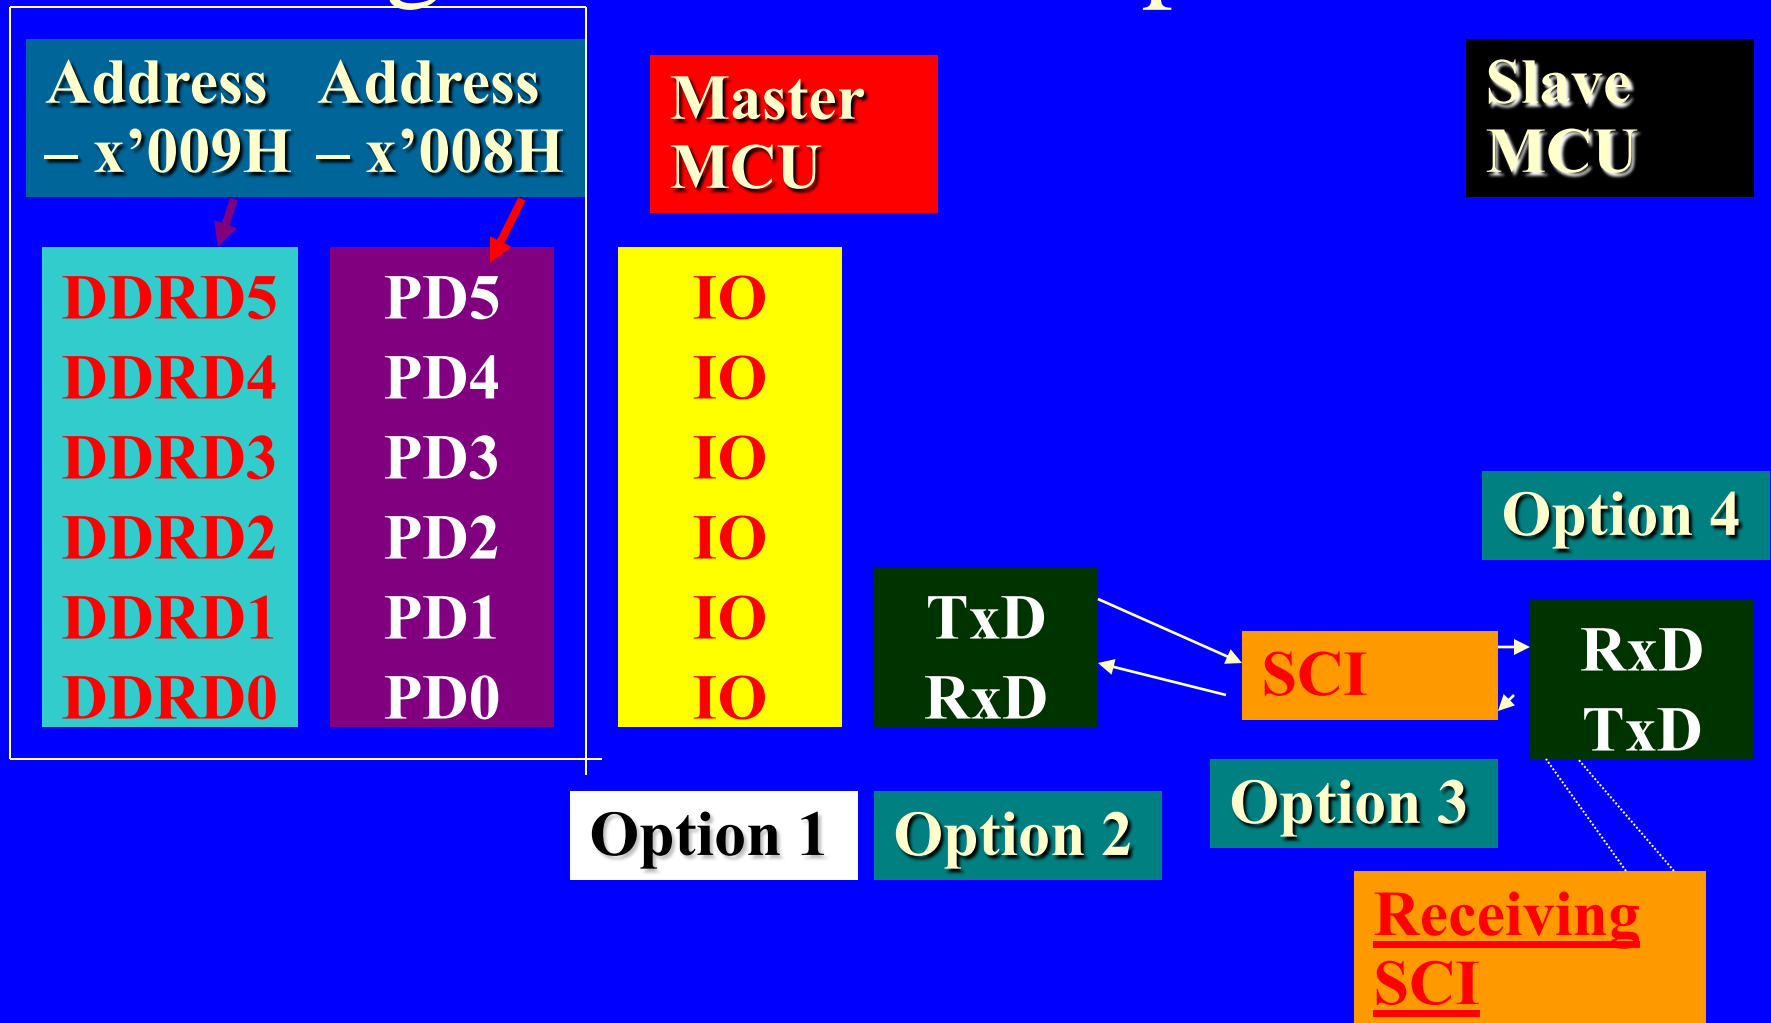

**There may or may not be separate addresses for each port bit in an MCU**

# Port bits can be either input port only, output port only, or a bi-direction port in Data Memory space

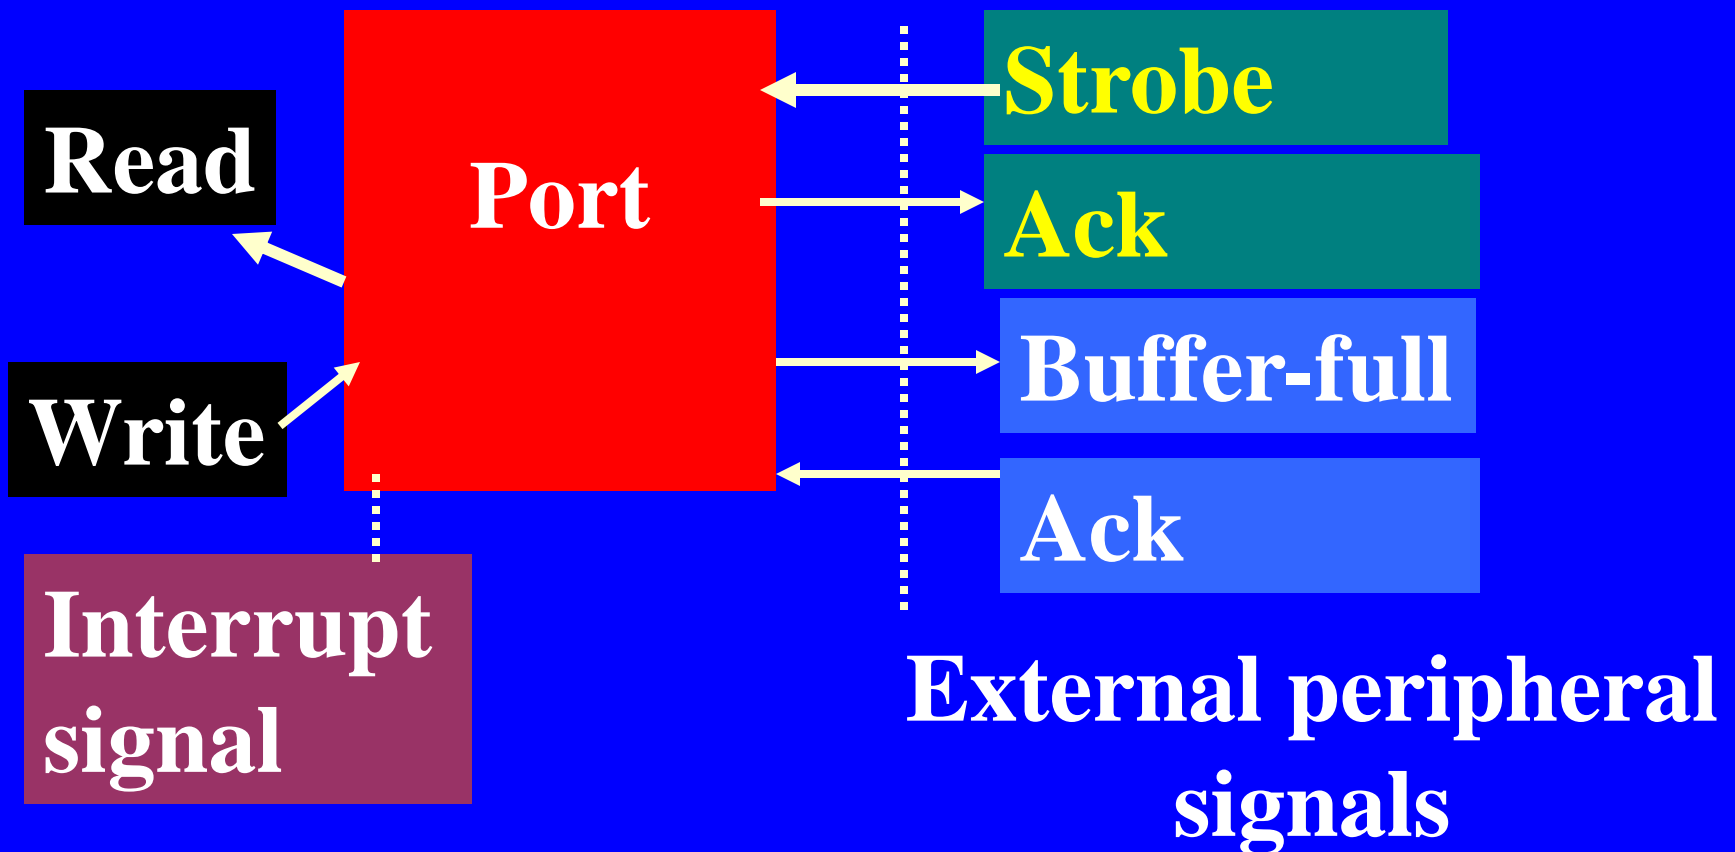

# Port bits with Data Direction bits in a register - An example

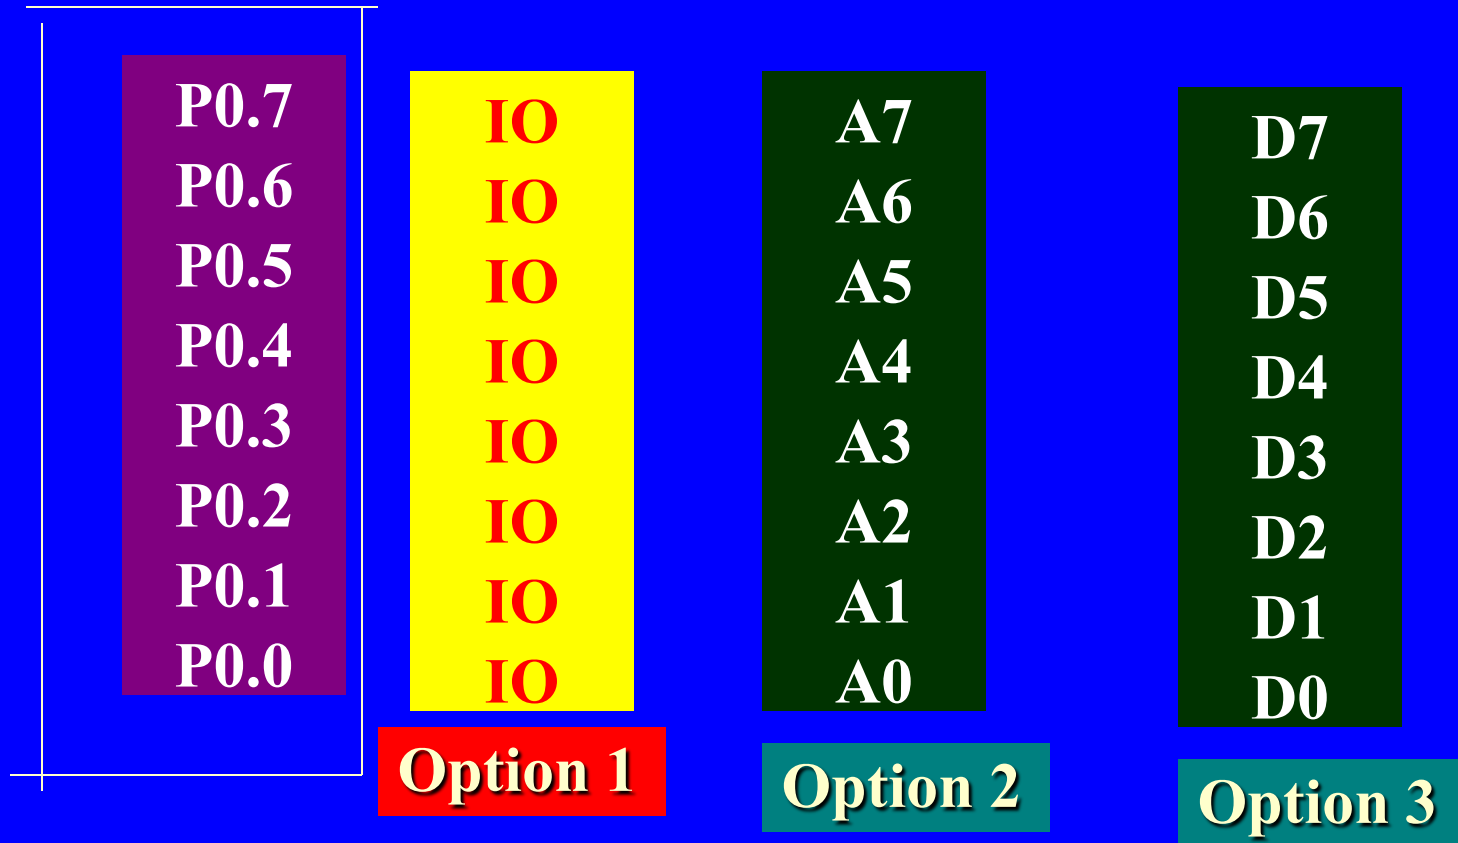

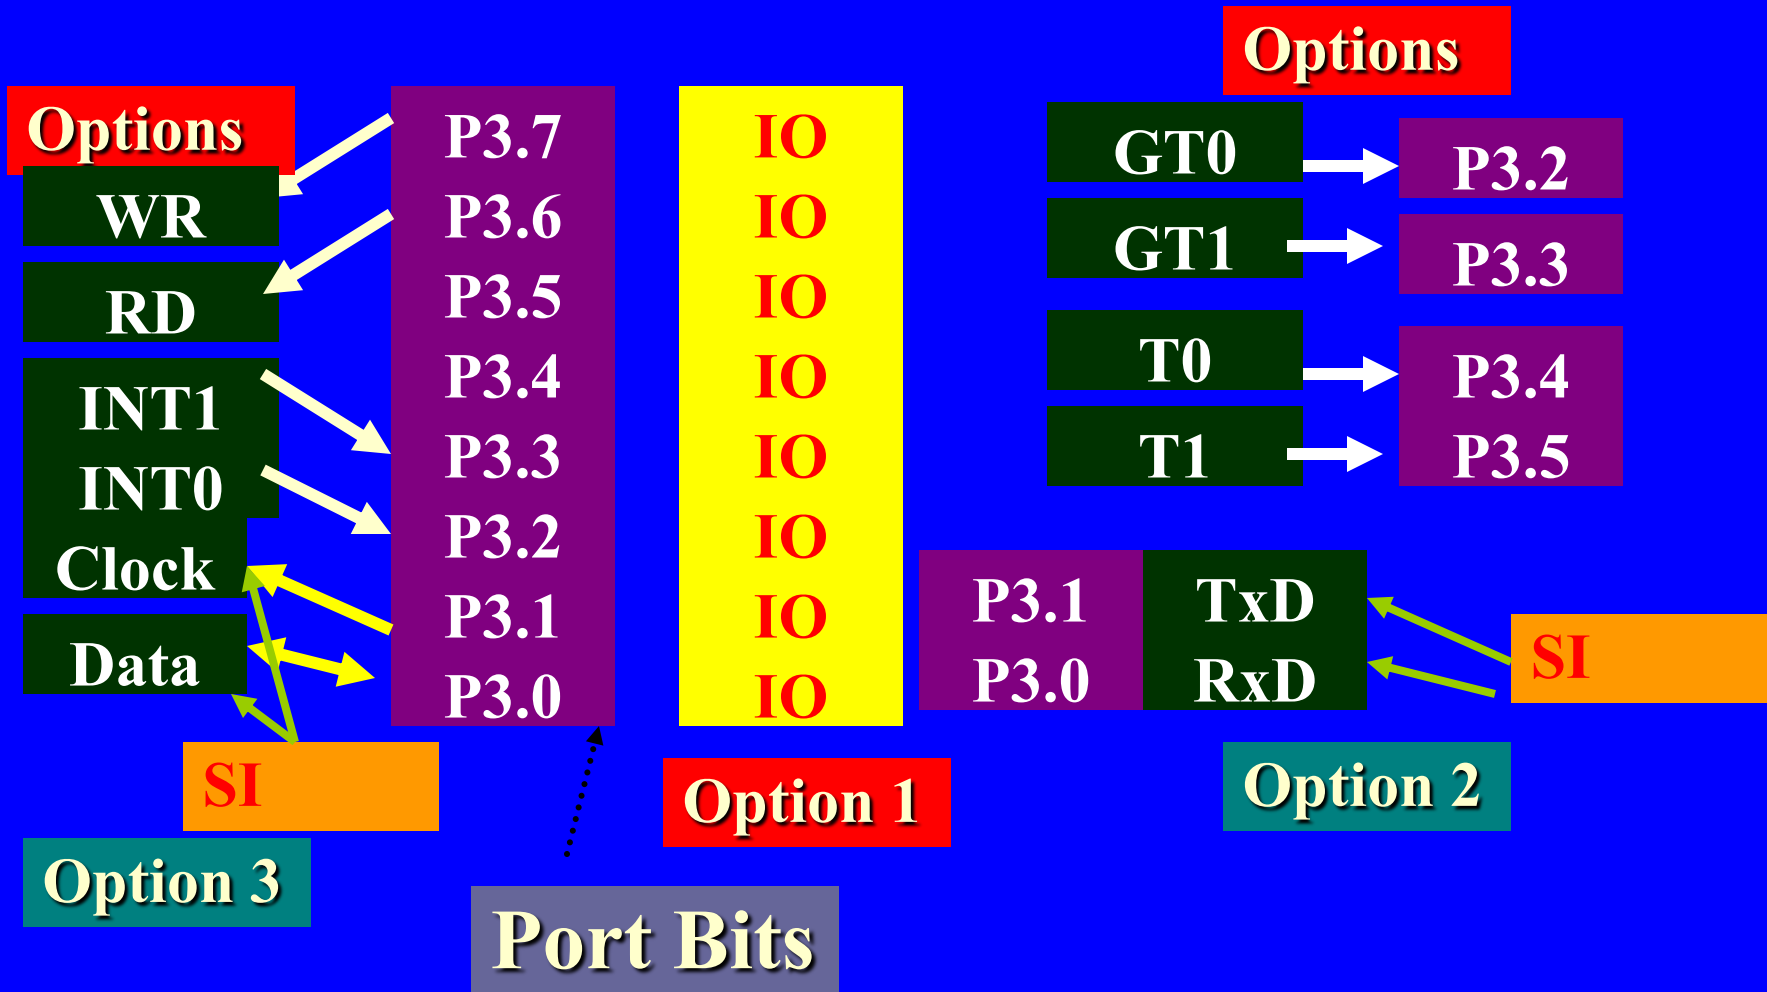

# Port use in handshake mode

# Port in Data Memory space - Options for port, address and data bus

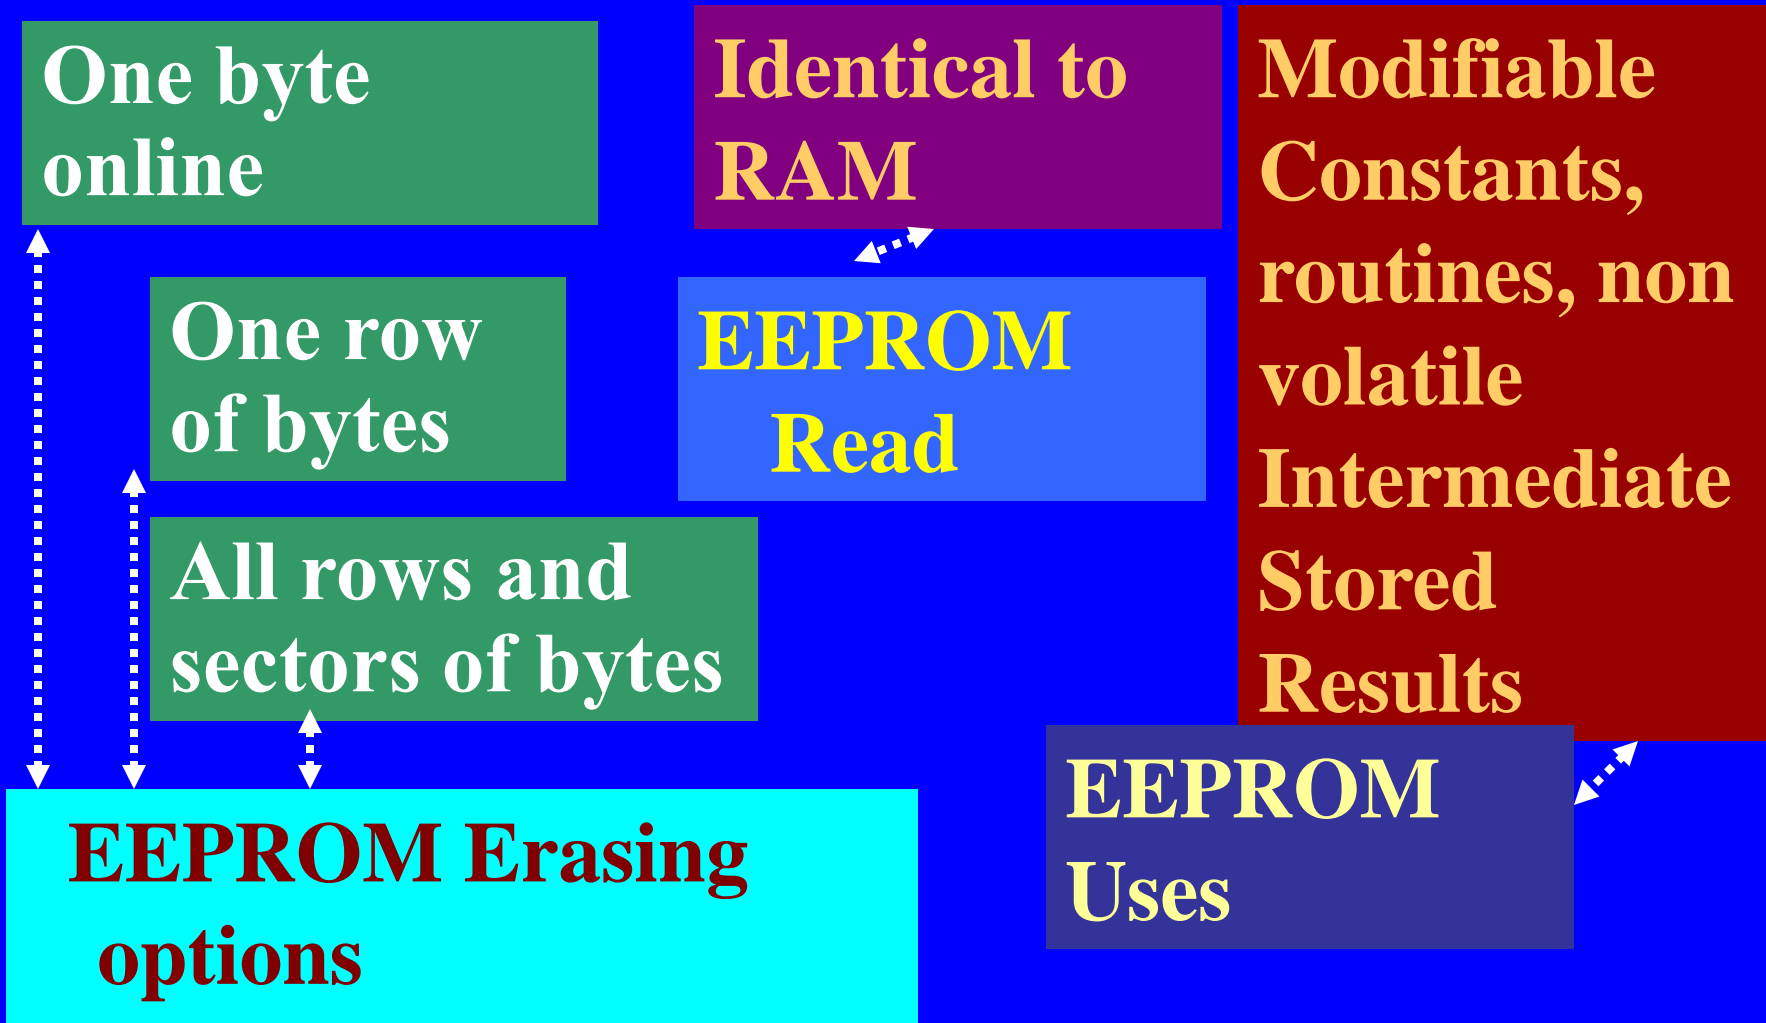

# Port in Data Memory space - Exemplary Options for port bits

# EEPROM

- 1. EEPROM like ROM is Non-volatile - means no change in bytes on power switch off**
- 2. Erasing means writing 1s at an address(es)**
- 3. Programming means writing bytes (1s and 0s) at the addresses for non-volatile uses**
- 4. Programming is by writing one byte in one write cycle at an erased address**

# EEPROM- Electrically Erasable and Programmable Memory

# FLASH

- 1. Flash like EEPROM is Non-volatile - means no change in bytes on power switch off**
- 2. Erasing means writing 1s at a sector addresses**
- 3. Programming means writing bytes (1s and 0s) at the addresses for non-volatile uses**
- 4. Programming is by writing one byte in one write cycle at an erased address**

# Flash- An Electrically Erasable and Programmable Memory

One sector of bytes online

Identical to RAM

Modifiable Constants, routines, non volatile Intermediate Stored Results

Flash Read

All sectors

A sector may be reserved for one time programming

Flash Uses

Flash Erasing options

# Summary

## We learnt

- Data Memory Space- Stacks, Ports and temporary data, queues, lookup tables, strings, control bits, status flags
- Program Memory - Programs, constants, stored tables, constant strings

# We learnt

- Memory
- ROM
- EEPROM
- Flash
- RAM

# We learnt

- Internal Data Memory and Internal Program Memory - Princeton Architecture (Common address space)
- External Data Memory and Internal Program Memory - Princeton Architecture (Common address space)

# We learnt

- Internal Data Memory - Harvard Architecture
- Internal Program Memory - Harvard Architecture
- External Program Memory - Harvard Architecture
- External Data Memory - Harvard Architecture
